

Step-by-step narrative

#	Action	Who	What happens (backend)
1	Draft	Submitter	Calls POST /proposals; ProposalRepo creates a Draft record.
2	Submit	Submitter	POST /proposals/{id}/submit → status → Submitted; admin notification & mock e-mail sent; SignalR pushes DashboardUpdated.
3	Assign Reviewer	Admin	POST /proposals/{id}/assign-reviewer → status → UnderReview; reviewer receives a notification & e-mail; real-time hub notifies them.
4	Review & Score	Reviewer	Loads queue (GET /proposals), opens a proposal, posts scores via POST /reviews. Review saved; dashboard updates for everyone.
5	AI Analysis (Submitter view)	Submitter	Click “Generate AI Analytical Report” → POST /proposals/{id}/analyze. AiAnalysisService builds AiAnalysisResult (scores, summary, risk, ROI, Suggestion). Result returned and shown in modal (new “Actionable Suggestion” block).
6	Decision	Admin	After reviewers have scored, admin clicks <i>Approve / Conditional Approve / Reject</i> → POST /proposals/{id}/decide. Updates status, approved amount, sends notification/email to submitter, pushes real-time update.
7	Capital Allocation	Admin	Once approved, admin creates a CapitalAllocation record (outside current UI).
8	Drawdown	Submitter	In SubmitterDashboard → fill draw-down form → POST /capital/drawdown. Capital allocation updated, transaction logged, dashboard refreshed.

9	Real-time UI Refresh	All roles	SignalR hub (NotificationHub) broadcasts DashboardUpdated and targeted notifications, keeping every open page in sync.
